Summary

Total tobacco production is forecast at 2.03 billion pounds this year, 14 percent above last year's short crop. Increases in both acreage and yield caused the bigger crop. With improved growing conditions, producers turned out the largest burley output since 1963 and the highest yielding flue-cured crop since 1964. Less acreage is expected for 1982 because of lower effective quotas for flue-cured and burley.

U.S. tobacco use may gain from last marketing year but will still fall short of production, leaving next summer's ending stocks 5 percent above the 3.3 billion pounds carried into this year. Domestic tobacco supplies for 1981/82 are 5 percent larger than last season, because the crop is bigger and stocks are 1 percent larger.

The tobacco price support and allotment program remains in effect after the House and Senate defeated amendments to either eliminate or substantially change the program. But an amendment to the 1981 farm bill would require USDA to develop an acceptable no-cost alternative within the law. Tobacco organizations are reviewing options for the changes Congress is expected to consider.

Auction prices for flue-cured tobacco fell after mid-September, when late season demand weakened. But season-average prices were record high, up 14 percent from 1980. Burley sales began in late November, with prices averaging well above a year ago. But, fire-cured and dark air-cured tobaccos prices have been lower.

Total tobacco use in 1981/82 may be up from last year. U.S. exports of unmanufactured tobacco during July-October 1981 increased in volume from a year earlier, and vigorous auction buying suggests that shipments will likely go above year-ago levels during the rest of the season. A more adequate burley supply indicates that disappearance will likely recover from last year's lower use.

U.S. cigarette output for 1981 may rise 2 percent above 1980 because of gains in exports and domestic use. Despite reduced U.S. economic activity and continued antismoking efforts, a growing adult population should nudge total cigarette sales in 1982 a little higher than 1981's record high. Also, chewing tobacco production is recovering. In contrast, the volume of cigar and smoking tobacco is declining and may continue that way.

With the usual heavy year-end volume, U.S. exports of unmanufactured tobacco (leaf) may have recovered enough to equal last year's 599 million pounds (272,000 metric tons or 721 million pounds, farm-sales weight). The total export value is up. Prospects for next year's exports have improved because of the better quality of 1981 U.S. output and slower production gains overseas.

Imports of unmanufactured leaf and processed scrap grew to 31 percent of U.S. manufacturers' tobacco use last marketing year—30 percent of use in cigarettes and 43 percent in other products. January-October imports for consumption (factory use) were 25 percent above a year ago. This year's total, including the Customs category for scrap tobacco, is expected exceed last year's

394 million pounds. A similar amount could enter in 1982.

The flue-cured tobacco supply during July 1981-June 1982—3.16 billion pounds—is up 2 percent from last year, reflecting the larger crop. Increased buying by domestic manufacturers and exporters pulled this year's grower prices to a record \$1.66 a pound, 22 cents above 1980. With marketings above indicated use, ending stocks are expected rise 50 million pounds above this year's 2.01 billion pounds.

The national flue-cured marketing quota for 1982 is the same as 1981. Tentatively, the effective quota (reflecting adjustments for net overquota marketings is 979 million pounds, 12 percent lower than 1981. Price support is expected to go up 11 percent next season, reflecting a rise in the USDA Prices Paid Index.

The burley tobacco supply for October 1981-September 1982 is 1.72 billion pounds, 5 percent above last season. However, the October 1 carryover dropped because of short crop last season. As of December 1, the 1981 forecast is 720 million pounds, 29 percent above 1980 outturn. Burley auctions opened November 23, prices for the first three weeks averaged \$1.80 a pound, 14 cents above last year. Over three-fourths of the crop may be sold in the pre-Christmas sales period.

The burley marketing quota and acreage allotment for several other kinds types under quota will be announced by February 1. Supplies of the Maryland fire-cured, dark air-cured, and cigar tobaccos are at a low level last season. As it now stands, the 1981 farm bill will effectively, prohibit the growing of Maryland tobacco outside of that State.

TOBACCO PRODUCTS

Cigarette Production Higher

Rising sales pushed 1981 cigarette production to a record level—2 percent above 1980 (table 1). U.S. consumption totaled 485 billion cigarettes during January-September 1981, 7 billion above a year earlier. Based on State cigarette tax receipts, unit sales for the first 9 months of 1981 registered a 2-percent gain over

the corresponding period of 1980. Despite the slowdown in several sectors of the economy, total cigarette consumption may continue to show small gains over the next 12 months. Sales of low-tar, low-nicotine cigarettes continue to grow as consumers shift from other brands. For 1981, low-tar cigarettes accounted for about two-thirds of the domestic market, compared with just less than half the market last year.

Retail cigarette prices in 1981 have averaged 8 percent higher than last year, which is less than the general rise for all consumer prices. Six States raised cigarette taxes this year, compared with four in 1980. By September, the weighted-average State tax was 13.4 cents a pack, 0.3 cents above a year earlier (table 3).

Smokeless Tobacco Use Gaining

Chewing tobacco output increased in the third quarter, although sales of looseleaf plug, and fine cut tobaccos remained stable. Total production for 1981 may exceed

last year's figure by 4 percent. Snuff production is above 1980 (table 2).

Third-quarter domestic use of smoking tobacco including imports—remained below a year earlier. For all of 1981, smoking tobacco consumption will likely decline slightly from 1980 (table 4).

Consumption of large cigars (including cigarillos) totaled 2.9 billion during January-September, 2 percent less than a year earlier. The 1981 total will be down by a similar percentage (table 2). With rising prices, a larger share of sales have become concentrated in the higher price categories, and this pattern is expected to continue in 1982.

U.S. EXPORTS AND IMPORTS

Exports May Pick Up in 1982

Exports of unmanufactured tobacco during July-October were above a year earlier but, for January-October, totaled 6 percent below a year ago. Shipments during the last 2 high-volume months of the year could be above November-December 1980. Total 1981 exports may equal 1980's 599 million pounds (272,000 metric tons, equivalent to 690 million pounds farm-sales weight) (table 5).

Calendar 1982 exports could rise a little and go beyond the 1975-79 average of 606 million pounds. More adequate U.S. supplies of desirable grades and smaller production gains overseas may offset higher domestic prices and less favorable dollar exchange rates.

For January-October 1981, flue-cured and burley—the principal export classes—registered decreases, as did Virginia fire-cured and cigar leaf (table 6). Among major markets, Europe, including the European

Export Markets for U.S. Tobacco

Million pounds

Unmanufactured, declared weight, year ending June 30.

USDA

Neg. ERS 487-81 (11)

Community (EC), took less U.S. tobacco, while Far Eastern markets, including Japan, purchased more (table 5 and 6). There were no exports under USDA-financed programs this past fiscal year (table 7).

Import Rise Continues

Through October, U.S. tobacco imports for consumption (duty-paid) were 25 percent above a year earlier (table 8). The gain occurred in cigarette tobacco, including the manufactured or not manufactured category. Oriental tobacco, the major import class, was up slightly,

reflecting larger cigarette output. Burley imports increased sharply, because of reduced domestic supply. Cigar leaf and scrap purchases rose in line with improved sales prospects for higher priced cigars. Imports continued to increase in 1982 because of their substantial competitive advantage over domestic tobacco.

U.S. stocks of foreign-grown cigarette and smoke tobacco rose over the past 12 months. On October 1981, stocks totaled 752 million pounds (farm-stock weight), 5 percent above a year earlier. Almost six-tenths of the foreign-grown stocks consisted of flue-cured tobacco and burley.

1981 TOBACCO LEGISLATION

In debating the 1981 farm bill, both the U.S. Senate and the House of Representatives considered amendments to the tobacco price support and allotment program. However, these amendments to either eliminate or substantially change the program were defeated. The House did pass unanimously a provision that requires USDA to operate the tobacco program at no cost except for administrative expenses and to recommend legislative changes needed to implement the provision. Recommendations are to be submitted during January 1982. Also

enacted was a provision that requires USDA to assess penalties on those who grow Maryland type-32 tobacco outside of that State.

In 1982, Congress is expected to hold hearings on possible program changes. Despite their relatively low cost to the Federal Government, program provisions such as marketing quotas, U.S. support prices above foreign prices, and allotment ownership by nonfarmers have been sharply criticized.

THE TOBACCO LEAF SITUATION AND OUTLOOK¹

1981 Crop Highlights

In response to 5-percent larger acreage and 8-percent higher yields, 1981 tobacco production is forecast to be 3.5 percent above last year. Also, the quality of the crop improved with a return to more moderate temperatures and a better distribution of rainfall. Flue-cured had a lower effective quota this season, while burley's was up. Acreage of all tobacco was the largest since 1976, and production per acre gained in most States (table 9 and 10).

Substantially larger crops of flue-cured and burley have brought larger supplies, but prices for the current

season are likely to average 15 cents a pound above last year and set a record. However, the gain is still short of the rise in support levels. Due to the increase in quality, the volume of tobacco placed under loan this season is falling below that of 1980. With the larger crop and higher prices, farmers' cash receipts from 1981 tobacco marketings are about a fourth above 1980, setting a record.

¹All quantities in this section are stated in the farm-sales-weight equivalent unless otherwise noted.

1982 Marketing Quotas and Allotments

The 1982 national quota, i.e., basic quota, for flue-cured tobacco is the same as for 1981. Subtracting the over-quota marketings from the 1981 crop, the effective quota (sum of individual farm quotas) is down 12 percent.

By February 1, USDA will announce the 1982 marketing quotas and acreage allotments for burley and several other kinds of tobacco. Shortly after that announcement, growers of fire-cured and dark air-cured types will vote for or against quotas on their next three crops. If at least two-thirds of those voting approve, marketing quotas will be in effect. Growers approved 1982 quotas in previous referendums for burley, flue-cured, sun-cured, Ohio filler, and Wisconsin and Connecticut binder tobacco.

Price Support To Rise

For 1982, an 11-percent increase from the 1981 price support is indicated. The law requires that the 1982 adjustment be based on the average of the parity index for 1979, 1980, and 1981, relative to the 1959 base. USDA usually announces average supports by tobacco

types in the spring and reports individual grade loan rates just before the opening of the various marketing seasons.

Foreign Leaf Production Increases

Global leaf production rose about 4 percent above last year's 13 billion pounds (5.8 million metric tons). Increases by major producers such as Cuba, China, United States, and the Soviet Union more than offset substantial decreases in Brazil, Zimbabwe, and Turkey. The major increases were in burley and flue-cured production. Oriental output declined.

Flue-Cured

1981 Auction Prices Gain Briskly

Prices for the 1981 flue-cured crop gained 15 percent from 1980, hitting a record. With a larger volume, the crop value rose one-fifth above a year earlier. Loan placements were down. Considering purchases from both the crop and Stabilization stocks, industry takings were up sharply from the lows of the past two seasons.

With brisk demand and limited amounts of the usual grades, early season prices averaged one-fifth above the previous year. The average price for all tobacco belts moved up sharply to a September peak but fell back in October, when export orders were satisfied and loan receipts increased.

Compared with the 1980 season, grade prices averaged substantially higher. The largest increases were for prim-

ings and nondescript. Gains were 10 to 40 cents a pound for about 80 to 85 percent of the grades. Over the belt the season-average price for gross sales (including resales) was \$1.66 a pound—up 22 cents from last year's average. Price averages were up in all belts (table 12). Among the 86 markets, season averages ranged from \$1.45 to \$1.75 a pound.

Despite the reduced effective quota, producers' marketing were above the last season. Auction sales totaled 1.144 billion pounds, 62 million more than in 1980.

Quality Improves

Crop quality was better than last year. There was a larger proportion of fair and good grades in 1981 and less low, poor, and nondescript quality tobacco. With better growing conditions in all areas, the share for leaf increased, and there was a larger amount of ripe or mature kinds and less variegated and green tobacco (table 13).

Loan volume reached 9 percent of sales, down from 13 percent in 1980. Most of the 1981 loan receipts consisted of variegated leaf and lug grades.

Auction Sales Ended November 16

Sales began in the Georgia-Florida area in mid-July, a little ahead of crop maturity. However, a sales holiday was declared for October 5-8 to allow redrying plants to process the backlog. By then, eight-tenths of the crop had been sold.

Allowable sales under USDA's marketing regulations averaged about 85 million pounds weekly, the same as last year; the resale allowance for warehouses remained at 10 percent. As in past seasons, growers designated a

warehouse for the sale of their crop, and the Flue-cured Tobacco Advisory Committee recommended opening dates and selling schedules to USDA. A buyer rotation plan was used, and selling times were allocated according to grower designations. Growers could change their warehouse designation at the beginning of each month.

Resales averaged 7 percent of gross sales, the same as in 1980. About 6 percent of the crop was sold outside the belt where it was produced (table 14). As was the case last season, there was no provision for the Stabilization Cooperative or warehouses to handle carryover tobacco. So, the volume held by individuals for sale next season has probably increased because of the bumper crop.

Export Volume May Expand

The improved quality of the 1981 U.S. crop, as well as larger supplies, boosted purchases this season. Short supplies in Zimbabwe and Brazil also strengthened U.S. auction purchases. Japan's 1981 purchases have gained a little from last season, but their shipments are usually bunched around the end of the calendar year. In general, larger supplies of U.S. export grades and smaller stocks abroad are pushing up 1981/82 exports to most destina-

tions. By June 1982, flue-cured exports could total a tenth or so above last year's total of 490 million pounds (table 15).

Supplies Increase in 1981/82

Although carryover was about the same, the larger crop has brought the season's flue-cured supply to 3.16 billion pounds—3 percent above last year (table 16). The 1981 outturn was the largest since 1978. Harvested acreage was down 3 percent from 1980, but the yield per acre was the highest since 1964, the last year of acreage allotments. A pickup in U.S. exports may offset lower domestic use for this marketing year, and total disappearance could gain from last year. Carryover next July could rise about 1 percent, with trade holdings accounting for most of the buildup.

The Flue-cured Stabilization Cooperative, the associa-

tion handling tobacco under loan, sold 211 million pounds during January-November, while loan receipts reached 106 million pounds. So, by January 1, 1982, the unsold loan stocks will fall considerably below the 597 million pounds held a year earlier.

The 1982 Quota

On December 1, USDA announced the national flue-cured marketing quota of 1,013 million pounds for 1982 (table 17).

Acreage allotments and poundage quotas for individual farms will reflect 1981 under and overmarketings. The base quota minus estimated net overmarketings means that the 1982 effective quota is about 979 million pounds, or 12 percent, below 1981. A crop close to the quota, when added to prospective carryover, would provide a 1982/83 supply that is 5 percent below this year.

The Foreign Flue-Cured Situation

In Ontario, Canada, this year's flue-cured production remained near the target level of 226 million pounds. Auctions opened in late September, and by late November, sales averaged \$C 1.51 or substantially above the guaranteed minimum of \$C 1.42 a pound (\$C=\$.84 S.). Based on a graduated scale of 5 to 14 cents a pound, the Canadian Manufacturers Council gives rebates for exports projected at 90 to 95 million pounds. Brazil's production of flue-cured tobacco decreased 10 percent in 1980/81. For 1981/82, output is not expected to rise much from a year earlier because of cost increases that have more than offset gains in selling prices. India expects a little larger crop in 1981/82 because of favorable demand; growers received higher prices for last year's larger crop.

The 1981 flue-cured crop in Zimbabwe declined 59 percent because of a quota cutback and low prices in 1980. But, prices were favorable for the 1981 crop, so the 1982 marketing quota has been raised to 96,000 metric tons (212 million pounds), more than 35 percent above 1981 (tables 18 and 19).

Burley

Record Price Averages

During the first 3 weeks of auctions, burley sales totaled 463 million pounds (gross) and averaged \$1.80 a pound. Even, with the large crop, growers may sell over three-fourths of it before Christmas. Sales resume January 4 (table 20).

Burley auctions through December 10 averaged 14 cents above last year, because quality improved. Sales contained larger percentages of both good grades and the

leaf category. All grades are selling well above support levels.

Loan rates by grades range from \$1.08 to \$1.81 a pound, with an average support level of \$1.636. Through December 10, loan receipts were 0.1 percent. Last season's receipts were practically nil.

For 1981/82, USDA is providing official grading and price support for untied burley packed straight in bales and offered for sale at auctions. This season, a sizable quantity is being sold in burlap sheets without support.

1980/81 Disappearance Reduced

During the year ending September 30, 1981, burley disappearance totaled 583 million pounds—8 percent below the previous year's record. Both domestic use and exports dropped because of the short supply of aged tobacco. With uncertainty as to the size of this year's crop, foreign and domestic buyers had to reduce their use to a sustainable level.

Domestic burley use fell 4 percent, despite an increase in U.S. cigarette manufacture in the same period. Although most burley goes into cigarettes, some is used in other products. A recovery in domestic use is in prospect for 1981/82.

Burley exports last crop year were 105 million pounds, 28 million below last year's record high. West Germany, Italy, and Japan remained the leading markets.

Supplies Increase

This season's burley supply, 1.72 billion pounds, is 8 percent above last season's 31-year low (table 8). The 1981 crop, estimated at 720 million pounds as of December 1, is 29 percent above last year. This season's effective farm poundage quota is 10 percent above last year, and growers increased acreage 18 percent. Yields are above the last two seasons, but are still below the average of recent years.

Because of short supplies, the carryover on October 1, 1981, fell 2 percent below a year earlier to the lowest since 1951. All of the carryover was owned by manufacturers and dealers, because there were no loan stocks. With the large crop, an increase in carryover to a more normal size is indicated. The 1981/82 supply is 2.75 times probable disappearance, or about the same as the desirable ratio. In addition, manufacturers and dealers held 265 million pounds of foreign-grown burley on October 1—49 million higher than a year earlier.

The 1982 Quota Decision

The 1982 outlook for burley hinges partially on the quota decision USDA will make by February 1. Burley poundage legislation requires that the national quota for any year can be neither less than 95 percent of estimated disappearance for that marketing year nor less than 95 percent of the previous year's quota. For 1981/82, the basic allotment was set at 660 million pounds. In contrast to the past season's low disappearance, the 625-million-pound average for 1977-79 (when supplies were more adequate) appears a reasonable base for a disappearance projection. Some increase in use is indicated for

¹Year beginning October 1. ²Includes sales and certification. ³Auction sales. ⁴November crop estimate. ⁵Estimated; excludes 11.6 mil. lb. of crop sold in October-November 1981.

1982/83. USDA has proposed three quota options for 1982, ranging from a 5-percent decrease to a 6-percent increase. The deadline for receiving written comments is January 13.

A carryover of undermarketings will be added to the 1982 quota, but the shortfall is expected to be considerably less than the past two seasons. So, the 1982 effective quota may decline sharply. The response to the quota averaged 88 percent for 1971-78, and the December production forecast is 85 percent.

Southern Maryland

1980/81 Disappearance Drops

During the year ending September 30, 1981, disappearance of Southern Maryland tobacco was 27 million

pounds, 6 million below the previous year and the lowest since 1972 (table 21).

Last year's crop sold for the highest of any auction sales in 1980/81. Domestic use of Maryland tobacco dropped 5 million pounds from the previous year. Exports totaled 9 million pounds—1 million below the previous year. Switzerland's takings were down to about six tenths of U.S. exports. Because of limited supplies of aged tobacco, total use in the current marketing year may change little from last season.

Supplies Gaining

The carryover of the old crop on January 1, 1982, forecast about 3 million below a year earlier. The 1981 crop is estimated at 45 million pounds, 14 million above the previous season and the largest since 1964. About one third of the crop comes from the flue-cured area. Acreage

lotments were not in effect, and the 1981 Maryland tobacco crop does not count against a flue-cured quota if it can be certified as Maryland type by USDA graders. The supply for 1981/82 (current crop plus estimated carryover) is 75 million pounds, 10 million more than a year earlier. Auctions for 1981 Maryland tobacco were held at several flue-cured markets after the flue-cured season ended. Growers sold 12 million pounds, averaging \$1.11 a pound. Sales will resume in February in the flue-cured area and will begin in Maryland in April. As it now stands, the 1981 farm bill would require that USDA apply penalties to those who grow Maryland tobacco outside of the State.

Fire-Cured

Auction Prices Drop

Auctions for Virginia fire-cured tobacco (type 21) opened November 23, with markets for the first six sales averaging 2 cents a pound below last season. The quality was better, but grade prices were down, mainly 5 to 9 cents a pound. Last year's reduced output caused prices to rise sharply, with the season-average climbing 19 cents above 1979. This year's Virginia crop is 1 million pounds more than last year's. Auctions for Kentucky-Tennessee fire-cured (types 22 and 23) are expected to open around the middle of January.

Larger Crop Stabilizes Supplies

At an estimated 42 million pounds, the 1981 fire-cured crop is 5 million pounds, or 10 percent, more than a year ago. The larger crop about offsets reduced carryover, bringing the 1981/82 supply to 113 million pounds. Based on last season's use, this would last 2-1/2 years. On October 1, the beginning of the marketing year, loan stocks had reached 17 million pounds. Annual disappearance varies widely from year to year, but the total carryover will probably decline next October (table 22).

Disappearance Lower

The disappearance of fire-cured types in 1980/81 was about 42 million pounds—1 million below the previous season. Domestic use decreased, while exports of Kentucky-Tennessee fire-cured increased and Virginia types dropped. Output of snuff and fine-cut chewing tobacco showed little change.

In Malawi, the largest exporter outside the United States, 1980 production was 22 million pounds, and at year's end, the 1981 crop was estimated at 26 million. Large surplus stocks from earlier crops have been reduced.

Dark Air-Cured

Auction Prices Mixed

Auction markets for One Sucker and Green River tobaccos (Kentucky-Tennessee dark air-cured, types 35-36) opened December 7 and December 2, respectively.

Auctions for Virginia sun-cured (type 37) started December 8. Growers received less for each type than they did for last season. For type 36, quality was about the same as in 1980, and loan receipts were up.

Supplies Increase

At an estimated 18 million pounds, the dark air-cured crop is up 1 million from 1980. The supply of dark air-cured and sun-cured tobacco for 1981/82, at 56 million pounds, is 3.3 million above 1980/81. Total supplies of dark air-cured tobacco represent over 3 year's use, based on last year's disappearance. Carryover may stay about the same, because disappearance may equal current production (table 23).

Disappearance Off

Disappearance of dark air-cured tobacco during 1980/81 was 15 million pounds, about 2 million below the previous marketing year, as domestic use declined. While the output of chewing tobacco gained, other uses declined. Higher prices for the 1980 crop may have hastened the drop.

Cigar Tobacco

U.S. and Puerto Rican Supplies Stabilize

Supplies of U.S. and Puerto Rican cigar tobacco are up a little in 1981, because carryover has risen. For 1981/82, production is about the same as a year earlier (table 25). However, the supplies of cigar filler and binder types have increased; wrapper supply has declined. On October 31, Government loan stocks stood at 11 million pounds of cigar tobacco, 2 million above a year earlier.

Production of U.S. cigar types is forecast virtually the same as 1980's outturn: the filler crop is up slightly, while binder and wrapper production is down. U.S. cigar leaf tobacco is sold either directly on farms or through cooperatives. As of early December, no sales had been reported. Season-average prices will be published in the May 1982 issue of USDA's Crop Report.

Filler and Binder Supplies Increase

Supplies of continental cigar filler (U.S. and Puerto Rican types 41-46) rose slightly this season to 92 million pounds because of increased carryover and a larger crop. Filler production was 1 million pounds more in 1981, and carryover rose. Based on recent disappearance, ending stocks are likely to decline by the close of the marketing year.

Supplies of cigar wrapper tobacco for 1981/82 are about 2 million pounds below last year, with both Connecticut Valley and Georgia-Florida wrapper supplies down. Type 62 tobacco has not been grown since 1977. The carryover next July 1 is likely to continue the long downtrend.

During October 1980-September 1981, manufacturers used about the same amount of imports as they did a year earlier—a response to almost steady cigar production and increased chewing tobacco output. Last season, 69

million pounds (farm sales weight) of cigar tobacco was imported for consumption. Stocks of foreign-grown cigar leaf in the United States on October 1 were 93 million pounds—about 2 million below a year earlier.

For 1981/82, binder tobacco supplies will rise with a

larger carryover. Cigar binder disappearance last season was 21 million pounds, down from a year earlier. The principal outlet for this type is looseleaf chewing tobacco. Binder disappearance has followed a cyclical pattern. So it may gain this year, but a stock increase is still likely.

COSTS OF PRODUCING BURLEY TOBACCO: 1980 AND 1981 AND PROJECTED 1982

**Verner N. Grise
Agricultural Economist
National Economics Division
Economic Research Service**

ABSTRACT: Variable and total costs per acre of producing burley tobacco rose by 11 percent in 1981 and both are expected to increase again, by about 6 percent in 1982. Prices of petroleum-based inputs and wage rates are forecasted to rise at a slower rate in 1982 compared with 1981. These estimates are based on information from a 1977 survey of 790 burley tobacco producers in the Bluegrass and south-central areas of Kentucky and north-central and eastern Tennessee. That information has been updated with prices for 1980 and 1981 and price projections for 1982. The level of technology and the input mix for 1980-82 are assumed to be the same as for 1976, except for market-preparation labor and fungicide use.

KEYWORDS: Burley tobacco, variable costs, total costs, yield.

INTRODUCTION

The costs of producing burley tobacco during 1980 and 1981, along with projections for 1982, are presented in this article. The major source of data for the cost estimates is a 1977 survey of the 1976 costs of 790 tobacco producers in five major Kentucky and Tennessee production areas (table 1). The data have been updated from the 1976 base period by use of price indexes for individual input items.¹ The technology and the input mix for 1980-82 are assumed to be the same as in 1976, except for two changes. Because of the outbreak of blue mold in the field in 1979 and the continued threat of this disease, it is assumed that 75 percent of 1980 production and 90 percent of 1981 and 1982 output are treated with a fungicide to control the problem. Also, farmers are changing from hand tying to baling burley tobacco as a means of preparing it for market. Baling reduces labor requirements. About 15 percent of the production in the study area was baled in 1980. It is assumed that 40 percent will be baled in 1981, and 60 percent in 1982.

Production costs vary widely from farm to farm because of differences in management, labor productivity, and other factors. The ones reported reflect the average costs of farmers in the specified production areas.

The cost estimates cover variable costs, machinery and barn ownership, and general farm overhead. Variable costs include expenditures for all labor, fertilizer and lime, pesticides, sucker control chemicals, curing and heating fuel, custom operations, fuel and lubricants, repairs, tobacco crop insurance, marketing fees, and other costs, such as seed and plant bed canvas.

Hired, family, and exchange labor are all charged at prevailing farm-wage rates. Machinery and barn ownership costs reflect the estimated age of these items for the years for which costs are calculated. General farm overhead includes costs for recordkeeping, utilities, and other items that are difficult to allocate to specific enterprises. Two additional cost components, management and land and quota (the right to grow and market tobacco without a penalty), are also estimated. The management charge is computed as 7 percent of the value of the crop. Crop value is calculated for 1980, using the average annual price received by farmers and estimated 1980 yields. For the 1981 preliminary estimate, the first two week's price average of \$1.80 a pound is used, and \$1.85 is the price projected for 1982. Yields for 1980 are based on USDA Statistical Reporting Service estimates within the study areas. The 1981 yield estimate is based on the Statistical Reporting Service's November 1 yield forecast, and the 1982 figure is an average of yields during the last 10 years.

The charge for land and quota is based on the net share rent approach. Net share rent is the value of the landlord's share of the crop after subtracting landlord payments for fertilizer, chemicals, and other inputs and allocating barn ownership costs.

¹For a more complete discussion of the concepts and procedures that underlie burley tobacco production cost estimates see "Cost of Producing Burley Tobacco—1976," Verner N. Grise, *Tobacco Situation*, TS-163, Washington, D.C., USDA, March 1978, pp. 37-42.

1/Includes much of what is usually referred to as the Inner Bluegrass of Kentucky.

2/Includes counties with more than half their physical area in what is usually termed the Intermediate Bluegrass of Kentucky.

3/Includes counties with more than half their physical area in what is usually termed the Outer Bluegrass of Kentucky.

COST CHANGES FROM 1980 TO 1981

The variable costs of producing burley tobacco rose 11 percent an acre in 1981 (tables 2 and 4). However, the increase was only 3 percent per 100 pounds, because yields were higher in 1981 than in 1980.²

Labor costs account for about 60 percent of all variable costs. Wage rates rose by 11 percent in 1981. A major factor in this increase was a 25-cent boost in the Federal minimum wage rate, from \$3.10 to \$3.35 an hour for farm employees covered under the law.³ Effective January 1, 1981, the higher minimum wage rate affected all farm employers, because noncovered farms are competing with covered farms for workers.

Fuel prices rose by 15 percent in 1981, compared with a 40-percent jump in 1980. Fertilizer prices also climbed more slowly, 13 percent in 1981, compared with 25 percent a year earlier.

Total costs per acre, excluding land and quota, rose 11 percent in 1981. Total costs per 100 pounds were 11 percent higher in 1981 (tables 3 and 5). Purchase prices of new machinery and construction costs of new buildings continued to climb as they have since the early 1970's.

Land and quota charges averaged \$51.12 per acre in 1981, compared with \$47.14 in 1980. This increase reflects higher tobacco prices that more than offset larger landlord expenditures.

²Yields for the United States are used, yield data by production area not available for 1981.

³Farm employers who have hired 500 or more man-days of labor during at least one calendar quarter of the previous year are subject to the Federal minimum wage rate.

PROJECTED COSTS IN 1982

With variable and total costs per acre are expected to rise about 6 percent in 1982 (tables 2 and 4). Costs per pound are expected to increase by 5 percent if yields are similar to the 1971-80 average (tables 3 and 5).

Wage rates are likely to rise again, but at a somewhat slower rate than in 1981. No change in the Federal minimum wage is scheduled in 1982. Also, unemployment rates may be higher in the general economy, and this might increase the availability of farm laborers. Furthermore, labor needs will decline as growers continue to change to less-labor-intensive methods of preparing tobacco for market.

Fuel prices may rise only slightly in 1982. Ample supplies of fuel are likely to be available, and demand for fuel in all uses has been declining.

Fertilizer prices are expected to climb more slowly in 1982. Nitrogen supplies should be adequate in 1982, and

phosphate and potash will likely be plentiful. For 2 years in a row, producer-held inventories of phosphate and potash have increased.

Pesticide prices are also expected to rise more slowly than they did last year. Supplies may be ample next year, and inventories are above normal.

Total costs, excluding land and quota, are projected to rise to \$3,385 an acre in 1982—\$145.60 per 100 pounds of tobacco. Despite an expected moderation in the rate of input price increases in 1982, variable costs, together with the costs of machinery, equipment, and barns, will continue upward. The charge for land and quota is forecast to increase to \$52.54 per 100 pounds, compared with \$51.24 in 1981.

SUMMARY AND CONCLUSIONS

The total cost per acre for producing burley tobacco, including land and quota, will likely rise by about 6 percent in 1982, compared with 11 percent in 1981. Key factors in the lower pace of expansion are the slower rates of increase in prices of inputs, such as fuel, fertilizer and wage rates.

Costs vary markedly from one tobacco grower to another. The cost estimates presented here are averages and

probably overstate those for a tobacco grower whose tractors, machinery, and barns are fully depreciated. On the other hand, the estimates understate the costs for a tobacco grower with new equipment and barns. Also keep in mind that the cost estimates include not only out-of-pocket costs but also an opportunity cost for the unpaid inputs of management and operator and family labor.
